<sup>1)</sup> All figures are based on 1 mm air gap (Total) and 2 spring packs

<sup>2)</sup> Braking force is based on a min clamping force, nominal coefficient of friction  $\mu = 0.4$  and 2 brake surfaces.

<sup>3)</sup> The piston travel at which the pressure limits is measured - the nominal pressure limits is identical to balancing pressure values

<sup>5)</sup> Pad pressure for organic pads respectively (based on max. clamping force)

## Specification

### BRAKING TORQUE

The braking torque  $M_B$  is calculated from following formula where:

$a$  is the number of brakes acting on the disc

$F_B$  is the braking force according to table above [N] or calculated from formula

$D_o$  is the brake disc outer diameter [m]

The actual braking torque may vary depending on adjustment of brake and friction coefficient.

$$M_B = a \cdot F_B \cdot \frac{(D_o - 0,2)}{2} \text{ [Nm]}$$

$$F_B = F_C \cdot 2 \cdot \mu$$
